

Appeal from Board of Appeals of the Patent Office.
Application for patent of Thomas F. Facius, Serial No. 425,783, filed Jan. 15, 1965; Patent Office Group 310. From decision rejecting claims 1 to 4, applicant appeals. Affirmed.

DAVIDSON C. MILLER, JOHN F. WITHERSPOON, and STEVENS, DAVIS, MILLER & MOSHER, all of Washington, D. C., for appellant.

JOSEPH SCHIMMEL (JOSEPH F. NAKAMURA of counsel) for Commissioner of Patents.

Before WORLEY, Chief Judge, and RICH, SMITH, ALMOND, and BALDWIN, Associate Judges.

BALDWIN, Judge.

This appeal is from the Patent Office Board of Appeals decision affirming the examiner's rejection of claims 1-4, all of the claims in appellant's application,¹ "as being unpatentable over the disclosure in Engalitcheff² in view of the disclosure in Dargavel³ under 35 U.S.C. 103."

THE INVENTION

The invention "relates to evaporative heat exchangers and in particular to improved apparatus for the distribution of water over a heat exchange surface." The specification states:

A water distribution system involving troughs spaced apart so that air could flow between them is disclosed in * * * [Engalitcheff]. This invention involves an improvement over the disclosure of that patent.

The invention is reflected in representative claim 1, subdivided herein with bracketed reference numerals added, when considered with reference to appellant's Figures 3 and 4 below:

1. A system for maintaining an even level of water in a series of troughs [11], each having notched side walls and being spaced apart in the same plane that comprises an elongated chamber [23], an elongated reservoir [25], a common wall [24] between said chamber and reservoir and defining

¹ Serial No. 425,783, filed January 15, 1965, for "Water Supply System."

² U. S. Patent 3,146,609, issued September 1, 1964, on an application filed April 27, 1964.

³ U. S. Patent 1,676,943, issued July 10, 1928.

"patentable inventions"; as "invention" is used in determining whether applicant has antedated reference, patentability is of no significance; applicant having shown that he originated inventions disclosed in reference, lack of novelty and/or obviousness was immaterial to overcome reference.—In re Facius (CCPA) 161 USPQ 294.

7. Interference—Originality of invention —In general (§ 41.551)

Patent evidences inventorship by patentee of everything both disclosed and claimed; however, existence of combination claims does not evidence inventorship by patentee of individual elements or subcombinations thereof if the latter are not separately claimed apart from combination.—In re Facius (CCPA) 161 USPQ 294.

8. Affidavits — Anticipating references (§ 12.3)

Rule 131 does not apply to case where publication appears without question to be a publication of applicant's own invention, even if publication should be in a patent.—In re Facius (CCPA) 161 USPQ 294.

9. Patentability—Invention—In general (§ 51.501)

Starting point for applicant's invention for purposes of 35 U.S.C. 103 is what applicant admits to be in prior art; however, his own invention, whatever the form of disclosure to public, may not be prior art against him, absent a statutory bar.—In re Facius (CCPA) 161 USPQ 294.

10. Patentability—Anticipation—Carrying date back of references (§ 51.203)

To antedate patent as reference, applicant must not only establish derivation of relevant disclosure from himself but also that he invented such disclosure; if applicant merely brought prior art to attention of patentee, disclosure is available against applicant, but, if he invented such disclosure, patent may not be used as reference against him notwithstanding patent's silence as to patentee's source of that subject matter; moreover, applicant's failure to claim invention disclosed in reference is not fatal to showing of inventorship; that fact may be established by any reference of record.—In re Facius (CCPA) 161 USPQ 294.

Particular patents—Water Supply Facius, Water Supply System, claims

1 to 4 of application refused.—In re Facius (CCPA) 161 USPQ 294.

Court of Customs and Patent Appeals

In re FACIUS

No. 8238 Decided Apr. 10, 1969

PATENTS

1. Affidavits — Anticipating references (§ 12.3)

Affidavits—Distinguishing from references (§ 12.7)

Even though affidavits purportedly under Rule 131 fail to satisfy requirements of that Rule, they are affidavits traversing grounds of rejection, which are permitted under Rule 132, and may be considered as evidence.—In re Facius (CCPA) 161 USPQ 294.

2. Patentability—Anticipation — Patents —In general (§ 51.2211)

Since patent is prima facie available as reference against applicant, burden is on applicant to establish the facts necessary to overcome patent.—In re Facius (CCPA) 161 USPQ 294.

3. Patentability — Anticipation—Carrying date back of references (§ 51.203)

Reference not a statutory bar under 35 U.S.C. 102(b) may be overcome upon proper showing of facts; one way to overcome reference is to antedate it, i.e., provide a factual showing that effective date of reference is not before applicant's invention.—In re Facius (CCPA) 161 USPQ 294.

4. Affidavits — Anticipating references (§ 12.3)

Most common way to antedate reference is to submit affidavit satisfying requirements of Rule 131.—In re Facius (CCPA) 161 USPQ 294.

5. Patentability — Anticipation — Carrying date back of references (§ 51.203)

It is significant that, in cited cases wherein applicants antedated reference patents, applicants showed that they themselves made the inventions upon which relevant disclosures in patents had been based; if all that applicants had done was to bring the invention of another to attention of patentees, then that disclosure in patent would have been invention of another and still available as prior art, albeit it was applicants' contribution to the disclosure.—In re Facius (CCPA) 161 USPQ 294.

6. Patentability — Anticipation — Carrying date back of references (§ 51.203)

Words and phrases (§ 70.) "Inventions" is a term broader than

sation of phenol and formaldehyde at an early stage. As shown by the Condensed Chemical Dictionary (* * * Sixth Edition, page 876, Fifth Edition, page 848), the resin obtained by arresting the base-catalyzed condensation of phenol and formaldehyde at an early stage is either an A- or a B-stage resin (resol or resitol). The resin described by Misuraca is a "heat reactive phenol formaldehyde resin" soluble in, inter alia, butyl alcohol * * *. As shown by the Condensed Chemical Dictionary (* * * Sixth Edition, page 876, Fifth Edition, page 848), only the A-stage resin (resol) is soluble in alcohol. Thus, Misuraca and Mossberg clearly show that either an A- or a B-stage phenol-formaldehyde resin is an obvious equivalent resin which may be used in lieu of epoxy resins in Hall.

Appellants' argument that novolak resins are not the equivalent of the resins of Misuraca and Mossberg is based on a contention that novolaks are thermoplastic while the resins of the references are thermosetting. Although it must be conceded that the Mossberg and Misuraca resins subsequent to baking have become the stage C, thermoset, phenol-formaldehyde resin, it is nonetheless clear that at the time of their application to the plates they are in the A- or B-stage as previously discussed. Thus, if the Misuraca or Mossberg resins were substituted in the Hall invention which does not require a baking stage (like appellants' method), the resins would be in the A- or B-stage. However, A- or B-stage phenol-formaldehyde resins are thermoplastic (Condensed Chemical Dictionary, Sixth Edition, page 876) as are the closely related novolak resins. Thus, in the invention as practiced by appellants and in the invention of the primary reference, in both of which no resin-baking stage is included, the distinction between thermosetting and thermoplastic properties is of no account. We are not, therefore, persuaded that the board was incorrect in considering the novolak resins of appellants to be apparent substitutes for the A- or B-stage phenol-formaldehyde resins of the secondary references.

Having considered the various arguments advanced by appellants, we are of the opinion that the board did not commit reversible error; therefore, the decision is affirmed.

holes [28] at spaced intervals therealong, the wall [27] of said reservoir opposite said common wall defining a plurality of outlet ports [29] each communicating directly with an end of one of said troughs, said ports generally conforming to the interior cross sectional shape of the trough served.

Additional structural features are recited in claims 2-4, but it will be apparent that we need not consider them.

Water issuing from a conduit 16 enters chamber 23 near the center thereof, flows through holes 28 in wall 24, and establishes a stable liquid level in reservoir 26. Reservoir 26 drains through wall 27 via ports 29 into the respective troughs 11 which spill water through notches 13 onto a heat exchange surface.

Appellant's application is assigned to Baltimore Aircoil Company, Inc.

THE REFERENCES

Engalitcheff, which issued prior to appellant's filing date, also is assigned to Baltimore Aircoil Company, Inc., and "relates to evaporative heat exchangers and in particular to improved apparatus for the distribution of water over a heat exchange surface." The specification states that:

there has been developed a system of troughs which can be filled to a predetermined level and which will spill water through notches * * *. Such * * * is disclosed in copending application S.N. 240,199 * * *. However, the apparatus of that patent application requires an overhead water supply to the troughs which * * * prevent[s] the flow of air counter-current to the water. * * *

It is an object of the present invention to improve upon the system of application S.N. 240,199 by providing a trough water distribution system which * * * permit[s] the water and air to flow in counter-current relationship * * *.

As illustrated in Figures 2-4 below, Engalitcheff discloses a water distribution system comprising parallel troughs 11 with notched side walls and an elongated water distribution box 21 at one end of the troughs. The water distribution box has an inlet conduit 15 and a series of orifices 22 for evenly distributing and metering the proper flow of water into each trough. A horizontal baffle 23 is provided in each trough; and the baffle has spaced orifices 24 to enable even water distribution in the upper part of the trough. Engalitcheff states that:

The feeding of water from the ends of the troughs 11 by the system of the present invention results in a very steady head of water in each trough throughout the length thereof even when that length is quite substantial. * * * [T]here is the further advantage that this manner of feed-

ing the troughs allows its usage with counterflow heat exchangers * * *.

Dargavel discloses a humidifier in which water is supplied to one end of a trough-shaped body. The water supply means, attached to one end of the trough-shaped body, comprises a shell-like body and a valve chamber which are separated by a common wall. Water enters the valve chamber through an inlet nipple and flows through an orifice in the common wall into the shell-like body and then into the trough-shaped body. As will be apparent, no further discussion of Dargavel is necessary.

THE REJECTION

In his first action, the examiner stated:

Claims 1-4 are rejected as being unpatentable over the disclosure in Engalitcheff in view of the disclosed chamber 16 and reservoir 12 of Dargavel under 35 U.S.C. 103. Engalitcheff discloses the claimed structure except for the use of a "chamber" as well as a reservoir. In view of the disclosed use of the combination of a chamber 16 and reservoir 12 in Dargavel, the use of a chamber in the device of Engalitcheff would be additive only, thus obvious in the sense of 35 U.S.C. 103.

In response thereto, purportedly under the provisions of Rule 131, appellant submitted his own affidavit, the pertinent passages of which read:

(4) That he [Facius] assisted in the development of the heat exchange apparatus which is illustrated and described in Patent No. 3,146,609, working with John Engalitcheff, Jr., * * *;

(5) That his contribution to the apparatus illustrated in Patent No. 3,146,609 was the water distribution box;

[I] * * * Although it seems clear that appellant's characterization of the affidavits as "Affidavits under Rule 131" was a misnomer, we said in *In re Land*, 54 CCPA 806, 825, 368 F.2d 886, 879-80, 161 USPQ 621, 633 (1966): "[T]he proper subject of inquiry [is] not compliance with Rule 131 but what the evidence [shows] as to who invented the subject matter disclosed by [the reference] which was relied on to support the rejection" and "[e]vidence of such a state of facts, whatever its form, must be considered." [Emphasis supplied.] Even though the affidavits fail to satisfy the requirements of Rule 131, they are "affidavits traversing grounds of rejection," which are permitted under Rule 132, and may be considered as evidence.

Fig. 2

Fig. 3

Water Level in Distribution Box

Fig. 4

(6) That he did not develop the trough structure shown and claimed in said patent, said trough structure being the sole invention of said John Engalitcheff, Jr.;

(7) That the application above identified was filed for the purpose of claiming his invention, that is the water distribution box. Accordingly, he knows that the water distribution box shown in Patent No. 3,146,609 was known to him before April 27, 1964, since it was his own design [Emphases added.]

Appellant also submitted the patentee Engalitcheff's affidavit which stated:

That he [Engalitcheff] has read the Affidavit of Thomas F. Facius * * * and that the statements of said Affidavit are to his personal knowledge true and accurate.

The examiner found the affidavits in sufficient to comply with Rule 131; he

then made final the aforementioned rejection.

In affirming the examiner, the board stated:

The bare allegation in appellant's affidavit that the water distribution box shown in the Engalitcheff patent is his contribution and was known to him prior to April 27, 1964, the filing date of the patent, and the bare statement in Engalitcheff's affidavit that the statements in appellant's affidavit are accurate are not a showing of facts within the contemplation of Rule 131(b). * * *

Appellant further contends that the Engalitcheff patent constitutes in effect appellant's own publication of the water distribution box shown but not claimed in said patent and, accordingly, he does not have to show completion of the invention before his own publication date or to swear back of his own work. We are not impressed with this argument.

The board quoted from the examiner's Answer that:

The question of patentability here is whether Engalitcheff is available as a reference against the claims of appellant. Appellant has not contested the propriety of the rejection should Engalitcheff prove to be available as a reference against the claims.

Appellant having made no contrary allegation of record, we accept those statements; and the sole issue is the availability of Engalitcheff as a reference against appellant.

OPINION

Although Engalitcheff has no claim to the water distribution box per se, representative claims 1-3 show what he did claim as his invention:

1. In an evaporative heat exchanger including a heat exchange region and means to pass air upwardly through said region, the improvement that comprises a plurality of generally U section troughs arranged in spaced relation above said region, each

That is, Engalitcheff has no claim directed to the sub-combination of the means to flow water into the troughs (e.g. the water distribution box). The only recitation, broad or narrow, of such means in the claims is in combination with the troughs; however, the water flow means is recited in varying scope within the seven combination claims. And, all of the claims are for the combination; that is, no claim is directed to the sub-combination of the trough, per se.

trough having V notches in a side wall, means to flow water into said troughs in a direction generally parallel to the longitudinal axis thereof, and means within each trough to maintain a constant level of water throughout its length whereby the flow from all the notches will be substantially equal. [Emphasis added.]

2. In an evaporative heat exchanger including a heat exchange region and means to pass air upwardly through said region, the improvement that comprises a plurality of generally U section troughs arranged in spaced relation above said region, each trough having V notches in a side wall, means to supply equal volumes of water to one end only of each of said troughs, and means within each trough to maintain a constant level of water throughout its length whereby the flow from all the notches will be substantially equal. [Emphasis added.]

3. In an evaporative heat exchanger including a heat exchange region and means to pass air upwardly through said region, the improvement that comprises a plurality of generally U section troughs arranged in spaced relation above said region, each trough having V notches in a side wall, a distribution box having orifices therein, each communicating with a trough, means to maintain a predetermined head of water in said box, and means within each trough to maintain a constant level of water throughout its length whereby the flow from all the notches will be substantially equal. [Emphasis added.]

As there is no double patenting rejection of record, this is only relevant in regard to the consistency between the aforementioned affidavits and Engalitcheff's patent claims and oath.

Engalitcheff contains no reservation clause since it is prohibited by Rule 79, and, of course, there could be no reference to the appellant's application in Engalitcheff as permitted by that rule since appellant had not yet filed when Engalitcheff issued. In fact, there is

United States Patent Office Rules of Practice in Patent Cases state:

79. Reservation for a future application of subject matter disclosed but not claimed in a pending application will not be permitted in the pending application, but an application disclosing unclaimed subject matter may contain a reference to a later filed application of the same applicant or owned by a common assignee disclosing and claiming that subject matter.

nothing in the Engaltcheff patent itself to the effect that the water distribution box was not invented by Engaltcheff or is to be attributed to anyone else. Thus, there can be no doubt that Engaltcheff is prima facie available as a reference against appellant.

[2] Since the patent is prima facie available as a reference against appellant, the burden is on appellant to establish the facts necessary to "overcome" that patent. We feel that appellant has failed to meet this burden.

[3] If a reference is not a statutory bar under 35 U.S.C. 102(b), then that reference may be "overcome" upon a proper showing of facts. One way to "overcome" a reference is to "antedate" it, that is, to provide a factual showing that the effective date of the reference is not "before the invention" thereof by the applicant for patent" as expressed in both 35 U.S.C. 102(a) and 35 U.S.C. 102(e).

[4] The most common way to "antedate" a reference is to submit an affidavit satisfying the requirements of Rule 131.⁷ This court's opinions in *In re Stemple*, 44 CCPA 820, 241 F.2d 755, 113 USPQ 77 (1957), *In re Wilkin*, 50 CCPA 701, 304 F.2d 673, 134 USPQ 171 (1962), and *In re Tanczyn*, 52 CCPA 1630, 347 F.2d 830, 146 USPQ 298 (1966), analyze what a Rule 131 affidavit must show to "antedate" a reference, particularly what "part" of the claimed invention must be proved to have been invented prior to the reference date.

In his brief, the solicitor quotes from Tanczyn, supra, 52 CCPA at 1630, 347 F.2d at 832, 146 USPQ at 301:

The primary consideration is whether, in addition to showing what the reference shows, the affidavit also establishes possession of either the whole invention claimed or something falling within the claim, in the sense that the claim as a whole reads on it. It is not sufficient to show in a Rule 131 affidavit that an invention wholly outside of that being claimed was made prior to the reference date. Such fact is irrelevant.

⁷ See *In re Harry*, 51 CCPA 1541, 333 F.2d 920, 142 USPQ 164 (1964), with respect to the requirements of a Rule 131 affidavit.

⁸ *Pierce v. Watson*, 107 U.S.App.D.C. 226, 275 F.2d 890, 124 USPQ 356 (1960), discussed the fact that an applicant could "sweat back" of a patent used as a reference under 35 U.S.C. 102(e) and recognized that "[s]uch procedure is authorized by Patent Office Rule 131 and, in certain situations, by Rule 132." [Emphasis added.] *Id.* at n. 2.

The solicitor then points out that appellant is claiming, in all instances, a water distribution box with an elongated chamber; and he argues that the affidavits therefore fail to establish "possession of either the whole invention claimed or something falling within the claim" since, at most, the affidavits establish possession, prior to the reference date, of a water distribution box without any chamber.

The solicitor's argument might have more force if the present appellant were seeking to "antedate" the reference by a Rule 131 affidavit in the conventional sense as was the situation in *In re Tanczyn*. But here, unlike Tanczyn, appellant has shown that the relevant disclosure in the reference was his own "contribution" to the apparatus disclosed therein; and he argues that, absent a statutory bar, one's own disclosure should not be available as a reference against him. Thus, as we view it, Tanczyn is inapposite to the present case.

As was pointed out in *In re Land*, 54 CCPA 806, 823, 368 F.2d 866, 878, 151 USPQ 621, 632 (1966), "Rule 131 * * * is only one way of overcoming a reference." As a matter of fact, appellant considers Land to be controlling and finds it impossible to distinguish the situation here from the situation in that case. In Land, a Land patent and a Rogers patent, each to individuals, were held to be available as prior art references for the purposes of a 35 U.S.C. 103 obviousness rejection of a Land-and-Rogers joint application, the same two individual patentees forming the joint entity. Land-and-Rogers had sought to "overcome" the references without "antedating" them; and they had filed no affidavits. The Land-and-Rogers joint invention undoubtedly had come after their individual inventions relied upon as prior art. The issue was solely a question of law concerning inventive entities, namely, whether Land and Rogers as individual inventors were each "another" with respect to Land-and-Rogers as joint inventors. The confusion therein had arisen as a result of an "unfortunate" remark in *In re Blout*, 52 CCPA 751, 333 F.2d 928, 142 USPQ 173 (1964), and the portion of the Land "opinion" to which appellant alludes, is essentially an explanation of the "true basis" of the Blout "decision."

⁹ "Decision" is not synonymous with "opinion." A decision of the court is its judgment or decree in settlement of a controversy submitted to it; the opinion is the reasons given for that judgment or decree, or the expression of the views of the court.

See Land, supra, n. 10. Thus, Land, is certainly not controlling and is so factually distinguished as to be inapposite to the present case other than for its enriching legal analysis.

Taken in this light, we view appellant as urging in *re Blout*, supra, as explained in *re Land*, supra, as controlling. In Blout, a Rogers patent, disclosing both non-insulated and insulated dye developers but not claiming the (e) anticipation rejection of a Blout-and-Rogers joint application claiming the insulated dye developers, the Rogers patentee and co-applicant being the same individual, Blout-and-Rogers submitted affidavits constituting sworn statements of fact clearly attributing the invention of the insulated dye developers to the joint entity, Blout-and-Rogers, as indicated by the Rule 79 cross-reference in the Rogers patent. Before discussing the legal implications of Blout, we should consider *In re Blout*, Patent Appeal No. 8008, 56 CCPA —, F.2d —, 161 USPQ 276 (1969), decided today, which involves facts quite similar to Blout; the reasoning of the two will be treated together, infra.

In Mathews, a Dewey patent, disclosing a time delay protective device with a particular gating means but not claiming the gating means, was the basis of a 35 U.S.C. 102(e) anticipation rejection of Mathews' application claiming the gating means, Mathews and Dewey being co-workers. Mathews submitted Dewey's affidavit averring that the relevant, unclaimed subject matter disclosed in his patent was not invented by him but was first disclosed to him by Mathews.

[5] In both Blout and Mathews, the references were prima facie available for the 35 U.S.C. 102(e) anticipation rejections but were deemed to have been "overcome." In both cases, the patents fully disclosed the claimed inventions, and that fact itself indicated that some one necessarily had made those claimed inventions prior to the filing dates; the only question in those cases was *who* had made the inventions upon which the relevant disclosures in the patents were based. If it were the appellants, then certainly appellants "antedated" the reference; and, not being a statutory bar, the reference could not negate appellants' novelty. In both cases, the fact established by affidavit was that the patentees had derived their knowledge of the relevant subject matter from appellants. Moreover, appellants further showed that they them-

selves had made the inventions ¹⁰ upon which the relevant disclosures in the patents had been based. This is a significant fact. If all the appellants had done was to bring the invention of another to the attention of the patentees, then that disclosure in the patent would have been the invention of another and still available as prior art, albeit it was appellants' "contribution" to the disclosure. In both Blout and Mathews, the appellants had claimed the inventions disclosed in the patents and had made oaths that they were the inventors of everything back described and claimed. The claims and antepended oath evidenced the fact of invention by the appellants. Thus, the appellants had made a satisfactory showing that the disclosure relied upon was a description of and based upon their own inventions. It necessarily followed, then, that the appellants had made their inventions prior to the filing dates of the respective patents. In effect, both Blout-and-Rogers and Mathews "antedated" the references by showing that the references did not, in fact, "evidence" lack of novelty. [I] That rejections are based on statutory provisions, not on references, and that the references merely supply the evidence of lack of novelty, obviousness, loss of right or whatever may be the ground of rejection" was pointed out in *In re Hilmer*, 53 CCPA 1288, 1313, 359 F.2d 859, 879, 149 USPQ 480, 496 (1966).

Turning now to the present case, we must determine what, on the basis of the facts established in the record, the Engaltcheff patent reasonably evidences.

[7] The solicitor urges "that a patent * * * constitutes, in itself, evidence of inventorship." We agree insofar as a patent evidences inventorship by the patentee of everything both disclosed and claimed. However, the existence of combination claims does not evidence invention by the patentee of the individual elements or sub-combinations thereof if the latter are not separately claimed apart from the combination. It is clear that the inventor of a combination may not have invented any element of that combination, much less each of the elements. Here, Engaltcheff did claim to be the inventor of the combination of troughs and a water distribution

¹⁰ [6] It goes without saying, that "inventions" is a term broader than "patentable inventions" and that, in this context, patentability is of no significance. Appellants having shown that they originated the inventions disclosed in the reference, lack of novelty and/or obviousness was immaterial to overcome the references.

box, but that does not evidence that he necessarily invented the water distribution box. Thus, we wholly disagree with the solicitor's contentions that "[t]he affidavits are clearly inconsistent with the claims of the Engalitcheff patent" and that there is a "presumption that the patent discloses only the patentee's invention."

The solicitor admits that Rule 131 is not the only way to overcome a reference which is not a statutory bar since Rule 131

is not " * * * intended to apply to a case where the publication appears without question to be a publication of the applicant's own invention." Ex parte Powell and Davies, 37 USPQ 286 (Bd. A., 1938).

[S] We agree with that statement and further recognize the soundness thereof even if the publication should be in a patent. On the other hand, we also agree with the solicitor that, on its face "[t]he Engalitcheff patent does not appear 'without question' to be a publication of the applicant's invention." That, however, merely makes Engalitcheff prima facie available as a reference; it does not conclusively establish the availability, and all of the facts of record should be considered in that regard.

[9] The solicitor additionally points out that appellant's claimed invention, as stated in the specification, "involves an improvement over the disclosure of * * * [Engalitcheff]." (Emphasis added.) The solicitor urges that, by appellant's own admission, the patent disclosure was appellant's starting point and that the prior art referred to in Section 103 includes an applicant's admission as to the starting point for his invention. We agree where that "starting point" is what the applicant admits to be in the prior art. But certain of disclosure to the public may not be prior art against oneself, absent a statutory bar.

[10] This, then, brings us to the crux of the present case. The real question is whether, in addition to establishing derivation of the relevant disclosure from himself, appellant has also clearly established the fact that he invented the relevant subject matter disclosed in the patent. If he merely brought the prior art to the attention of the patentee, then the disclosure in the patent is available against appellant even though appellant was, in a fashion, responsible for that particular disclosure (i.e., it was his "contribution" to the disclosure since he "communi-

cated" the subject matter to the patentee). If on the other hand, appellant *invented* the subject matter upon which the relevant disclosure in the patent was based, then the patent may not be used as a reference against him notwithstanding the patent's silence as to the patentee's source of that subject matter. In this sense, the reference could be "overcome" since it would not be prior art against appellant. In re Blout, supra; In re Mathews, supra. See also In re Land, supra.

Appellant has not established inventorship in the same manner as did Blout and Rogers and Mathews since he did not claim the relevant subject matter in the patent¹¹ but rather only claimed an improvement thereon. However, failure to claim the invention disclosed in the reference is not fatal to a showing of inventorship; that fact may be established by any evidence of record.

Here, there are only the aforementioned affidavits to evidence inventorship of the water distribution box disclosed in Engalitcheff. In reviewing the affidavits, we feel that they are not consistent with the possibility of appellant's having merely brought the prior art to the attention of the patentee and perhaps having done some "design" work on it, not significant enough to have made the water distribution box *his invention*. From the affidavit, appellant merely "assisted in the development of the heat exchange apparatus" disclosed in Engalitcheff in that "his contribution * * * was the water distribution box." [Emphasis added.] All that is clearly identified as appellant's invention is the water distribution box claimed in the present application, as stated in the first portion of (7) in the quoted passage of the affidavit, supra. That Engalitcheff's water distribution box was known to appellant prior to Engalitcheff's filing does not establish appellant's inventorship thereof. Although appellant may have done some "design" work, he has not seen fit to characterize it as "his invention"; hence, we are not inclined to do so. Thus, we feel that appellant has not met the burden of proving facts sufficient to overcome the prima facie available reference.

¹¹ Of course, if appellant had claimed the disclosed water distribution box without the chamber, then appellant would have in view of the facts established by the affidavits, "antedated" the reference since he would have shown possession prior to the reference date, of either the whole invention claimed or something falling within the claim."

Accordingly, the board's decision is affirmed.

Judge SMITH participated in the hearing of this case but died before a decision was reached.

Patent Office Trademark Trial and Appeal Board

THE NARDA MICROWAVE CORPORATION v. SAGE LABORATORIES, INC.
Decided Feb. 24, 1969

TRADEMARKS

1. Evidence—Of confusion (§ 67.337)

Testimony by purchasers that they have not been confused because of marks, opinion testimony as to likelihood of confusion, and fact that examiner did not cite opposer's mark as reference against applicant are entitled to no weight by Board in reaching conclusions as to likelihood of confusion.—Narda Microwave Corp. v. Sage Laboratories, Inc. (PO TM TAppBd) 161 USPQ 303.

2. Identity and similarity—How determined—Descriptive or disclaimed matter (§ 67.4061)

Marks and names subject to ownership — Descriptive — Particular marks (§ 67.5081)

Since "Line" is descriptive as applied to a line of products, it is entitled to little weight in evaluating marks.—Narda Microwave Corp. v. Sage Laboratories, Inc. (PO TM TAppBd) 161 USPQ 303.

3. Identity and similarity—How determined—Adding to other's mark (§ 67.4053)

Fact that applicant's mark incorporates letters or word contained in opposer's mark is not controlling on issue of likelihood of confusion.—Narda Microwave Corp. v. Sage Laboratories, Inc. (PO TM TAppBd) 161 USPQ 303.

4. Identity and similarity—Words and symbols (§ 67.413)

"M-Line" does not so resemble "Microline" that confusion is likely.—Narda Microwave Corp. v. Sage Laboratories, Inc. (PO TM TAppBd) 161 USPQ 303.

Trademark opposition No. 47,434 by The Narda Microwave Corporation

against Sage Laboratories, Inc., application, Serial No. 256,772, filed Oct. 19, 1966. Opposition dismissed.

MCGREGOR & EISENMAN, Mineola, N. Y., for The Narda Microwave Corporation.
WOLF, GREENFIELD & HIEKEN, Boston, Mass., for Sage Laboratories, Inc.

Before LEACH, WALDSTREICHER, and SHRYOCK, Members.
SHRYOCK, Member.

Sage Laboratories, Inc. has filed an application to register the mark "M-LINE" for microwave components, namely, hybrids, mixers, couplers, and the like, use since at least as early as September 26, 1966 being asserted.

Registration has been opposed by The Narda Microwave Corporation, registrant by assignment of "MICROLINE" for electric high frequency testing and measuring apparatus for testing and measuring high frequency electrical equipment and phenomena — namely, characteristic monitoring, measuring and indicating apparatus; wattmeters, matching transformers, impedance meters, wave meters, frequency standards, and standard cavities; an electrical high frequency apparatus consisting of electric high frequency transmission lines, wave line guides and associated apparatus including fittings therefor.²

Opposer has taken testimony and applicant has submitted affidavit testimony of certain witnesses under the provision of Trademark Rule 2.123(b), and copies of more than fifteen third-party registrations³ for marks ending in "line" in the microwave or related fields under Rule 2.123(c). Both parties have filed briefs and were represented at final hearing.

Opposer's testimony shows that since July, 1966 it has used the mark "MICROLINE", as shown below, on a line of commercial microwave instruments and/or components. The mark was first used as early as 1960 by Sperry Gyroscopic Company which, apparently, by successive mergers became the Sperry Rand Corporation.⁴ Opposer acquired

¹ Reg. No. 441,990, issued Feb. 8, 1949, to a predecessor-in-title.

² Reg. No. 444,660, issued Feb. 26, 1952 to a predecessor-in-title.

³ In addition, there are three registrations, ending in the suffix line, owned by applicant.

⁴ The oral testimony is lacking in any specifics as to the claim of title from Sperry Gyroscopic Company to opposer, but the Patent Office assignment records, as referred to in the testimony establish that opposer is the present owner by recorded
